

Self-adhesive metal strip

The term covers metal foil tape and metal blanks. This refers to designs of the product range M-Tech[®]F to which an additional adhesive layer has been attached.

After the protective film has been removed, the layer is 0.06 mm thick.
See also the glossary entry "self-adhesive metal foil".

Variants

These self-adhesive products exist both in standard version and special variants. Standard version, so-called M-Tech[®]F/s, is the metal strip whose subsurface is set with adhesive film.

For the optimal sticking effect of the metal strip on the surface, it is recommended to use the suitable self-adhesive materials. In this case product recommendations with adapted adhesive tapes are proposed according to customer's wish. The production can begin right after the approval.

Please enquire for the special variants for M-Tech[®]F/s.
